Three-phase line and commutating reactor acc. to VDE0570-2-20 (EN61558 /IEC61558)

Type code:

- KDD: Three-phase commutating reactor / 3UI-core / vertical

Generally:

- Commutating reactor: This reactor, connected in incoming circuit on the AC-side of converter installations, causes:

## - A lower ripple

- Attenuation of the current harmonics
- Realisation of the short-circuit voltage (uk) of 4\%
- Reduction of the steepness of the current rise during commutation as well as with short-circuit or short-circuit to frame.
- Degree of protection IP00 (suitable for installation in enclosures up to IP20)
- Ground connection as preparation for fitting in gears and systems of class of protection
- Dimensioning for pollution severity P2
- Maximum ambient temperature $40^{\circ} \mathrm{C}$ / Insulation class F
- Frequency 50 Hz / - dimensioned for continuous operation (ED = 100 \%)
- Vacuum-resin impregnated
- Connections - currents up to ca. 250 A on transformer terminals - shockproof according to VBG4
- currents higher than ca. 250 A with bolt connection - shock protection has to be ensured by the installation

## Standards and basics

- VDE0570-1 (EN61558-1 / IEC61558-1) - follow-up standard for VDE0550-1 "Safety of transformers, power packs and the like"
- VDE0570-2-20 (EN61558-2-20 / IEC61558-2-20) - follow-up standard for VDE0550-5 „Particular requirements for small reactors"

- General technical conditions and information (see page 78)
$\frac{-\quad \text { Variants of voltage: }}{400 \mathrm{~V} \text { (other voltages on request) }}$

## Remark:

When inquiring for a reactor with other nominal values you should consider that following data is decisive for the calculation of a line or commutating reactor, as long the short-circuit voltage - uk (voltage drop) shall amount 4\%:

| - nominal voltage (phase voltage) | -U in Volt |
| :--- | :--- |
| - nominal current | $-I_{\mathrm{N}}$ in Ampere |
| - inductance | -L in mH |
| - effective current | - Ieff |

- effective current - leff

To do the calculation the nominal current $\left(I_{N}\right)$ has to be known (herewith the effective current - nominal current + effect of the current harmonics - has to be considered).

## Dimension c1 = 60-100 mm

## Options (on request)

[^0][^1]
[^0]:    - Installation in enclosure (see page 32)
    - Snap-on fixing (up to size 0,2 KVA
    - Additional tappings and windings

[^1]:    - Adding of elements for temperature monitoring (e.g. PTC-thermistors)
    - Reactors in horizontal construction form
    - Reactors with higher power
